FUNCTIONAL TESTING

Overview

Olenick & Associates provides software testing, quality assurance, project management, and IT service management consulting services to ensure the success and quality of client's projects, applications, processes, and infrastructure.

Service Highlight: Functional Testing

Olenick & Associates conducts functional testing projects for clients using manual testing and test automation. For test automation projects, O&A utilizes industry leading and open source functional testing tools. O&A has implemented functional test solutions for client's web, packaged software, and custom N-Tier applications. The following diagram shows the O&A delivery methods, competencies, and service offerings with a focus on **Functional Testing**:

All areas of system functionality are evaluated during a project, including application features/software, requirements, usability, and the overall environment. Application usage profiles and tendencies are integrated into the evaluation, test approach, and subsequent functional test framework.

FUNCTIONAL TESTING

DEPLOYMENT READINESS™ Overview

Olenick & Associates has created and developed the DEPLOYMENT READINESS™ Methodology to support all aspects of every project. This methodology is client, software application, and operations focused. The DEPLOYMENT READINESS™ approach elevates the awareness of issues and risks before a software application is deployed to production.

The following high level diagram shows the **Functional Test Readiness** component of the DEPLOYMENT READINESS™ Methodology:

Functional Test Readiness is designed to decrease test re-execution time for subsequent releases, and maintain complete test coverage of the application. Functional Readiness also provides the flexibility to address the changing nature of functionality during the life-cycle of software development.

All test assets created in Functional Test Readiness can be fully leveraged for subsequent post-deployment release. Test assets include test conditions, test scripts, test data, defects and test result tracking; and the processes and infrastructure to support all assets.
