PERFORMANCE TESTING

Overview

Olenick & Associates provides software testing, quality assurance, project management, and IT service management consulting services to ensure the success and quality of client's projects, applications, processes, and infrastructure.

Service Highlight: Performance Testing

Olenick & Associates conducts performance testing projects for clients using industry leading and open source performance testing tools. O&A has implemented performance test solutions for client's web, packaged software, and custom N-Tier applications. O&A performance test engineers hold certifications in many different performance testing tools and utilize industry proven practices in developing performance test models. The following diagram shows the O&A delivery methods, competencies, and service offerings with a focus on **Performance Testing**:

All areas of system performance are evaluated during a project, including application features/software, architecture, hardware, network/bandwidth, and the overall environment. Application usage profiles and tendencies are integrated into the evaluation, test approach, and subsequent performance test framework.

DEPLOYMENT READINESS™ Overview

Olenick & Associates has created and developed the DEPLOYMENT READINESS™ Methodology to support all aspects of every project. This methodology is client, software application, and operations focused. The DEPLOYMENT READINESS™ approach elevates the awareness of issues and risks before a software application is deployed to production.

The following high level diagram shows the **Performance Test Readiness** component of the DEPLOYMENT READINESS™ Methodology:

Performance tests are executed in an iterative fashion to identify bottlenecks and application performance issues. Generally, 3 to 5 test cycles are executed based on the project performance test requirements.

A post-deployment strategy is also developed to ensure the proactive monitoring and assessment of the client systems for performance monitoring.

The strategy includes the identification of areas where performance risks may exist and the identification of techniques that can be employed to minimize system and application outages or disruptions.
